2010-2014 Honda Insight - Cabin Air Filter

2010-2014 Honda Insight | Easy | 10-15 minutes | $28 DIY

TOOLS
No tools required - the whole job is done by hand

PARTS
Cabin air filter for 2010-2014 Honda Insight; verify arrows, size, and VIN/trim fitment $28.00

STEPS

1. **Open and empty the glove box - With the Insight parked and the ignition off, open the** glove box and pull everything out. On the second-generation Insight (2010-2014), the cabin filter sits behind the glove box inside the A/C evaporator housing on the passenger side.
2. **Disengage the stay damper - Unhook the stay damper from the glove compartment - on the** Insight it attaches to the right side of the box. Slide or pop it off its post so the door can swing down freely.
3. **Bend the stoppers inward and drop the door - Carefully bend the two stoppers on the sides** of the glove box inward to release them from the dash, then lower the glove box down and out of the way.
4. **Remove the filter cover and old filter - Pull off the cabin filter cover on the** evaporator housing, then slide the old filter out. Check the airflow arrow printed on the frame and note its direction - you'll mirror it on the new filter.
5. **Install the new filter - Set the new filter into the evaporator housing with the airflow** arrow pointing the same direction as the old one's. Make sure it seats fully in the housing with no edge sticking out - an incompletely seated filter lets air blow around it...
6. **Reassemble the glove box - Refit the filter cover, lift the glove box back into place,** and pop both stoppers back into their slots. Reattach the stay damper on the right side of the box.
7. **Test the HVAC and set the interval - Start the engine and run the blower through every** speed with the A/C on. Airflow from the vents should be strong and even, with no rattling or whistling behind the dash.
