# 2017-2020 Hyundai Elantra - Cabin Air Filter

**2017-2020 Hyundai Elantra | Easy | 20 minutes | $26 DIY**

**TOOLS**
Gloves Safety Glasses Vacuum
Flashlight

**PARTS**
Cabin Air Filter TRQ CFA04610 $25.95

## STEPS

1. **Open glovebox and release stoppers - Open the glovebox and empty it. Turn the two** stoppers inside the glovebox to the LEFT to unlock them; the glovebox swings fully open, exposing the filter area. No damper arm or screw on this model - just the twist stoppers.
2. **Locate the filter cover - With the glovebox hanging down, look behind it. You'll see a** black plastic cover over the filter opening. This is the filter door. The white cabin filter is behind this cover.
3. **Remove the filter cover - Remove the black filter cover by pinching the two sides of the** cover together and pulling it straight off. It should come off easily. Set it aside. The white cabin filter is now visible in the opening.
4. **Remove the old filter - Pull the old white cabin filter straight out. Note the airflow** arrow direction on the old filter - the new one goes in the same way. If the filter is dirty/clogged, that's why your AC smells or has weak airflow.
5. **Install the new filter - Slide the new filter into the housing, matching the airflow** arrow direction from the old one. Ensure it's fully seated. Reinstall the black cover by pushing it back on until the sides click. The cover should sit flush.
6. **Reassemble and test - Swing the glovebox back up. Turn the two stoppers to the RIGHT to** lock them. Close the glovebox. Test the AC - airflow should be strong and clean. Replace every 15,000-20,000 miles or when airflow drops.
