2020-2024 Kia Telluride - Engine Air Filter

2020-2024 Kia Telluride | Easy | 10-20 minutes | $20 DIY

TOOLS
Screwdriver or socket (if housing uses screws) Rag or shop vacuum Gloves

PARTS
Engine air filter Fram CA11943 $20.00

STEPS

1. **Prep and locate the air box - Park on level ground, parking brake set, engine off. Spring** clips hold the lid; no tools needed (confirm the clip style on your housing). Compare the new filter against the old one - the wrong element means a second trip.
2. **Open the air filter housing - Flip the spring clips around the lid open with your** fingers, working around the perimeter. Lift the lid up and tilt it back - the attached ducting flexes enough to leave connected. Note the alignment tabs as you lift.
3. **Remove the old filter and clean - Lift the old panel filter out, noting its orientation** and airflow-arrow direction. Vacuum grit from the box bottom, keeping debris out of the intake opening. Don’t disturb the MAF sensor or its wiring in the intake tract.
4. **Install the new filter - Drop the new filter into the lower box with its airflow arrow** correct and rubber sealing edge fully in the groove, as the old one sat. Press around the perimeter - seal flat, no gaps or lifted corners.
5. **Reseal and verify - Set the lid evenly onto its alignment tabs and snap each spring clip** shut with positive tension. Tug the lid to confirm every clip is engaged and the ducts are snug.
