2012-2017 Toyota Camry - Replace Cabin Air Filter

2012-2017 Toyota Camry | Easy | 5-10 minutes | $20 DIY

TOOLS
Clean dry cloth

PARTS
Cabin Air Filter 87139-YZZ08 $20.00

STEPS

1. **Park, switch off, and set the climate to recirculate - Park on level ground, set the** parking brake, and turn the ignition to accessory - not started. Press the recirculation button on the climate panel so the system switches to recirculate mode. Then switch the ignition fully off.
2. **Open the glove box and look inside - Open the passenger door and the glove box. On the** 2012-2017 Camry you don’t need to drop or remove the glove box at all - the filter cover is visible right inside the box, behind whatever you keep in there.
3. **Pop the filter cover off its right-side tab - Find the small rectangular cover on the** back wall of the glove box. It has a release tab on its right side - press or pull that tab and the whole little door pops off. Set it aside.
4. **Slide the filter case out of the housing - Grip the filter case and slide it straight out** of the housing toward you. The pleated filter element sits inside this case like a tray.
5. **Clean the case and drop in the new element - Set the new filter into the case in the same** orientation as the old one, making sure it lies flat with no buckled corners. A buckled corner leaves a gap where unfiltered air rushes past the element.
6. **Slide the case home and confirm it latches - Slide the loaded filter case back into the** housing until it seats fully - it should glide in with light pressure and stop flush. Give it a light tug to confirm it’s latched.
7. **Close up and test the airflow - Put your items back in the glove box and close it. Start** the car, switch between recirculate and fresh-air modes, and run the fan from low to high.
